Excel Duplicate Record Check

Project README

This project demonstrates how Microsoft Excel can be used to identify repeated records, document duplicates, and prepare a cleaned dataset for analysis.

Project Objectives

- Identify duplicate records using a COUNTIFS formula.
- Create a Duplicate Report to document repeated combinations.
- Create a Cleaned Copy by removing duplicate combinations.
- Practice data quality checks and basic data-cleaning workflow.

Tools Used

Microsoft Excel: COUNTIFS, filters, Remove Duplicates, worksheet organization.

Workbook Structure

- **Original Data** — source practice dataset.
- **Duplicate Report** — rows identified as repeated records and an audit note.
- **Cleaned Copy** — dataset after removing repeated combinations.

Duplicate Detection Method

The COUNTIFS formula checks whether the combination of Customer, Product, Quantity, and Sales has appeared earlier in the dataset. The Order ID is excluded from the matching key because each order ID is unique. A TRUE result marks a repeated occurrence; FALSE marks the first occurrence.

Expected Results

For the sample dataset supplied with this task, the expected result is 5 repeated occurrences and 10 unique combinations after deduplication. Verify these counts against your final workbook.

How to Use

1. Open the Excel workbook.
2. Review the Original Data sheet.
3. Check the Duplicate Report and audit note.
4. Review the Cleaned Copy before using it for analysis.

Note

This is a practice project. Duplicate detection is based on the selected business columns, not on Order ID. In real datasets, confirm the correct duplicate key with the business rules before deleting records.
